

Abstract

A decorative texturized fabric is provided. The fabric is produced from a fabric substrate that includes a yarn nappable from one side of the substrate. For instance, in one embodiment, the fabric substrate is a warp knitted fabric. According to the present invention, the fabric substrate is treated with a size composition according to a particular pattern. The fabric is then napped causing a nap to form on one side of the fabric where the size composition has not been applied. In this manner, a texturized pattern is formed into the fabric. After napping, the size composition can be removed from the fabric and the fabric can be dyed.
